Definitions

Measured IDs

- Each caliper finger records a radius value at each depth sample. For the purposes of calculating metal loss, this value is multiplied by 2, creating an ID value which can be referenced against the nominal ID and OD of the tubular (all ID values quoted are 2* radius values unless otherwise indicated).
- When calculating restrictions within the tubular caused by features such as deposition or deformation, opposite arm radius values are combined to create an ID value.
- At each depth sample the Maximum ID, Minimum ID and Mean ID is recorded. These can then be plotted against the Drift ID and Nominal ID and OD.

Maximum Percentage Penetration

- The maximum percentage penetration is the maximum recorded radius x 2 value referenced against nominal ID and OD
- $Maximum\ percentage\ penetration = 100 * \frac{Max.ID - Nom.ID}{OD - Nom.ID}$

Maximum Percentage Circumferential Wall Loss

- The maximum percentage circumferential wall loss is the sum of the areal metal loss at each depth sample with reference to nominal ID and OD
- $(\frac{100}{N}) * \sum_{i=1}^{i=N} (Si^2 - Nom.ID^2) \div (OD^2 - Nom.ID^2)$
- N: is the number of caliper sensors on the tool, 24, 40, 60.
- Si: is the measured radius value x 2 for each arm.

1. Survey Objectives and Interpretation Summary

Survey Objectives

An extended 24-arm memory multifinger caliper was run to determine the general condition of the tubing and casing within the ROSSUM-WEERSELO-5 well.

Data Analysis

This report highlights the main findings of the analysis. However, for a more detailed view of the tubing condition, the accompanying deliverables (which include the tool data and the MIPS client viewer) can be used to inspect the completion on a joint-by-joint basis.

Processing:

- Centralised
- Depth corrected – to well completion depths, MD in metres
- Recalibrated to remove minor individual arm drift
- Statistical analysis applied

Interpretation Summary

- The 5", 15 lb/ft tubing, 4", 10.9 lb/ft tubing and short surveyed interval of 7", 32 lb/ft casing all appear to be in good condition overall, with no clear evidence of any significant metal loss or damage.
- Time-lapse analysis shows only minor potential change between surveys.

Statistical Data Summary	2023	2022	2021	2020	2019	T.L. Max Difference
Maximum % Penetration	22.3 %	20.4 %	29.2 %	26.7 %	20.2 %	9.0 %
Maximum Penetration Depth	1118.00 m	1124.18 m	1134.81 m	1134.76 m	1128.54 m	-
Average Maximum % Penetration	12.3 %	15.0 %	10.8 %	14.9 %	12.9 %	4.2 %
Maximum % Circumferential Wall Loss	14.0 %	12.1 %	16.1 %	16.9 %	13.7 %	4.0 %
Maximum % Circumferential Wall Loss Depth	1171.69 m	788.71 m	1134.81 m	1134.76 m	1128.54 m	-
Average Recorded Mean ID	4.472 inches	4.413 inches	4.548 inches	4.383 inches	4.320 inches	0.228 inches
Average Maximum % Circumferential Wall Loss	4.9 %	7.3 %	3.4 %	7.2 %	5.3 %	3.9 %
Survey Interval	1259 to surface	1130 to surface	1351 to surface	1151 to surface	1136 to surface	-

Note: All values from statistical analysis are based on the maximum, minimum and mean IDs per tubing or casing joint
Note: Caliper measurement tolerance is 0.03"

Client: NAM	Well No.: ROSSUM-WEERSELO-5	Field: ROSSUM-WEERSELO
Survey Date: 25/09/2023	Survey MFC-24 Extended	Job ID: DAC880

2. Data Interpretation

5", 15 lb/ft Tubing Condition

- The 5", 15 lb/ft tubing appears to be in good condition overall, with all 89 joints logged found to contain maximum recorded percentage penetration values below 18% of the nominal wall thickness, averaging 12% (see Figure 1, Section 3 & Max. Percentage Penetration per Joint vs. Depth Plot, Section 4).
- There is no clear evidence of any significant metal loss or damage within the 5", 15 lb/ft tubing. Furthermore, the average mean recorded ID of 4.426" remains somewhat close the manufacturer specified nominal ID of 4.408" (see Measured ID per Joint vs. Depth Plot, Section 4).
- The minimum recorded ID within the 5", 15 lb/ft tubing was 4.210" at 185.68 m. This relates to what appears to be a small, localised area of deposition or loose well debris (see Figures 2 & 3, Section 3).

4", 10.9 lb/ft Tubing Condition

- The 4", 10.9 lb/ft tubing appears to be in good condition overall, with all 6 joints logged found to contain maximum recorded percentage penetration values below 23% of the nominal wall thickness, averaging 16.3% (see Figure 4, Section 3 & Max. Percentage Penetration per Joint vs. Depth Plot, Section 4).
- There is no clear evidence of any significant metal loss or damage within the 4", 10.9 lb/ft tubing, with toolstring decentralisation effects above and below SPMs responsible for most slightly higher than expected IDs. Furthermore, the average mean recorded ID of 3.498" remains somewhat close the manufacturer specified nominal ID of 3.476" (see Measured ID per Joint vs. Depth Plot, Section 4).
- There are no clear signs of any significant deposition or restrictions within the 4", 10.9 lb/ft tubing, and none of the recorded IDs fall below the manufacturer specified drift ID of 3.351".

7", 32 lb/ft Casing Condition

- The surveyed interval of 7", 32 lb/ft casing appears to be in good condition overall, with all 6 joints logged found to contain maximum recorded percentage penetration values below 20% of the nominal wall thickness, averaging 12.5% (see Figure 5, Section 3 & Max. Percentage Penetration per Joint vs. Depth Plot, Section 4).
- The maximum recorded ID within the surveyed interval of 7" casing was 6.271" (equivalent to a 19.5% penetration) at 1175.75 m. This relates to a joint with a significantly higher overall ID throughout than any other surrounding joints. It is possible that this may simply be a joint of a lower weight, such as 29 lb/ft (see Figures 6 & 7, Section 3).
- There are no clear signs of any significant deposition or restrictions within the 7", 32 lb/ft casing, and none of the recorded IDs fall below the manufacturer specified drift ID of 5.969".

Time-lapse Analysis

- 24-arm caliper surveys have been performed previously within this well by Expro. Time-lapse analysis has been performed by comparing data from surveys conducted on the 14th of November 2019, 12th of November 2020, 26th of June 2021 and 29th of November 2022 with data from the current 2023 survey to give a 5-survey overview (see Time-lapse Plots, Section 4).

Client: NAM	Well No.: ROSSUM-WEERSELO-5	Field: ROSSUM-WEERSELO
Survey Date: 25/09/2023	Survey MFC-24 Extended	Job ID: DAC880

- The 7" casing condition cannot be consistently compared between surveys as this was only surveyed in 2021 and 2023. However, based on these two surveys, it does not appear that the condition has changed significantly.
- It does not appear that there has been any drastic change in the general condition of the 5" or 4" tubing between 2019 to 2023. The plotted curves overlay fairly consistently and show a very similar profile and features. Any variation can most likely be attributed to differences in tool, tool calibration and the rotational path of the toolstring throughout the survey. Nevertheless, there are no clear signs of any severe metal loss present in any of the surveys.
